Exercise 4: Terroir: Short Answer/Fill in the Blank

1. Climate refers to the historical, average weather of a certain place, or what is expected to happen in the long run. Weather is the actual meteorological conditions forecast in the short term, as well as what actually occurs.
2. Approximately 20–30 inches/51–76 cm.
3. Less fertile soils encourage the vine to produce less vegetation and fewer grapes, leading to well-ripened grape bunches rich in sugar and phenolics.
4. Clay (smallest), silt, sand, gravel (largest).
5. A vineyard at higher elevations will be cooler, windier, and have less fog. The higher altitude vineyard will also have more intense sunlight and larger diurnal temperature swings.
6. Water tends to change temperature more slowly than soil, so vineyards situated close to large bodies of water experience less temperature fluctuations. Their diurnal temperature range is less, summers are not as hot, and winters are milder. The humidity can also provide for morning or evening fogs as well as greater cloud cover, rain, and dampness.
